

LIVE WITHOUT PAIN!!!!!!

Pain is a symptom of an injury. When you only treat the symptom you're ignoring the original cause of the pain. **Laser Therapy treats the injury itself.** It works in a **curative** manner by treating conditions at the cellular level. The pain goes away because the condition has improved or has been cured.

Laser Therapy stimulates cellular activity, providing more energy that's needed to heal and repair damaged soft tissue. It's a **non-invasive** therapy that's **relaxing** and **painless**. There are no negative side effects.

If you've recently injured yourself, Laser Therapy can help you **return to your active lifestyle much sooner** than using conventional treatment methods.

If you've been living with chronic pain for months or even years, Laser Therapy can **eliminate those sleepless nights and pain-filled days in just a few weeks.**

What is Low Intensity Laser Therapy?

Low Intensity Laser Therapy is the use of monochromatic light emission from a low intensity laser diode or an array of high intensity superluminous laser diodes to treat musculoskeletal injuries, chronic and degenerative conditions and to heal wounds. The light source is placed in contact with the skin allowing the photon energy to penetrate tissue, where it interacts with various intracellular biomolecules resulting in the restoration of normal cell morphology and function. This process also enhances the body's natural healing abilities.

What does Low Intensity Laser Therapy do?

By affecting and reversing the offending pathology at the cellular level, laser therapy optimizes the restoration of injured tissues to function normally, thereby alleviating the symptom of pain. The beneficial effects of laser therapy are cumulative over the course of a series of treatments.

How long does a treatment take?

Treatments are typically 30-60 minutes in length and a treatment program statistically requires an average of 10 treatments.

How many treatments are needed?

The number of treatments will vary with regard to the individual problem. Just as every medical condition varies so will the individual response to therapy. The onset of pain relief as a result of treatment varies depending on each patient's response to Low Intensity Laser Therapy. In a recent study of over 1000 patients treated with the BioFlex Professional Laser Therapy System, patients averaged slightly less than 10 treatments to resolve their condition.

How much does each treatment cost?

The fee for a 30 minute treatment is \$45 incl. GST.

What are the side effects associated with Low Intensity Laser Therapy?

Unlike many pharmaceutical options, Low Intensity Laser Therapy is non-toxic; unlike surgical procedures it is non-traumatic and most importantly it is non-invasive.

What is the frequency of treatments?

In **acute conditions** it may be appropriate to have frequent treatments for 4 days or longer. Once the symptoms have diminished, 2-3 treatments per week are required until stable followed by 1-2 times per week until improvement is 80% or more.

In **chronic conditions** treatments will begin with 2-3 times per week until stable followed by 1-2 times per week until improvement is 80% or more.

Stopping treatments prematurely will dramatically decrease the success rate of resolving the condition.
